# Exercise Method Prediction

## Gueller

## 7/18/2020

#### Overview

In this assignment, we will use data collected as part of a Human Activity Recognition (HAR) <sup>1</sup> study and use machine learning to determine how effective the data collected is for prediction of the quality of how the exercise activity is being performed.

The activity is "Unilaterial Dumbbell Biceps Curl". Each participant was asked to perform 10 repetitions, 5 different methods. Essentially, one method was correct, the other four were incorrect in a defined manner. The manner in which the activity was completed is captured in the "classe" field; the definitions of the classe categorizations is shown in the Appendix.<sup>2</sup>

## **Executive Summary**

Three models (Decision Tree, Random Forest and Generalized Boosted Method) we applied against the cleaned data. Cross-validation found that the Random Forest provided the most accurate prediction for the given data.

#### Setting the Environment

```
knitr::opts_chunk$set(echo=FALSE)
# Always set the seed
set.seed(1994)
# Libraries
library(caret)
library(rpart)
library(rattle)
library(randomForest)
library(knitr)
library(corrplot)
library(RColorBrewer)
library(kableExtra)
```

## Loading, Cleaning and Arranging the Data

```
# locations of the data
trainURL <- "https://d396qusza40orc.cloudfront.net/predmachlearn/pml-training.csv"
testURL <- "https://d396qusza40orc.cloudfront.net/predmachlearn/pml-testing.csv"</pre>
```

```
# read the data in
training <- read.csv(url(trainURL))
testing <- read.csv(url(testURL))
dim(testing)</pre>
```

```
## [1] 20 160
```

We will be working with the training set for now, holding out the testing set for the quiz.

Exploration of the data set using head revealed that the first 7 columns of the data are identifiers that will be removed. Using the is na function revealed that a number of the fields were almost entirely NA (97.9%), and those will be removed as well, exploration of the data is in the Appendix.

```
# capture the exploration and print output in the Appendix
headUC <- head(training, 2)
naUC <- sapply(training, function(x) sum(is.na(x)))
# Remove Identifiers
training <- training[,-(1:7)]
dim(training)</pre>
```

```
## [1] 19622 153
```

```
# Remvove NA's
remNA <- sapply(training, function(x) sum(is.na(x))) > 0
training <- training[,remNA==FALSE]
dim(training)</pre>
```

```
## [1] 19622 86
```

The near zero variance variables will be identified and removed.

```
nearZero <- nearZeroVar(training)
# nearZero
training <- training[,-nearZero]
dim(training)</pre>
```

```
## [1] 19622 53
```

The testing set will be broken into trainSet and testSet.

```
# Break the training set into training and test
inTrain <-createDataPartition(training$classe, p=0.7, list=FALSE)
trainSet <- training[inTrain,]
testSet <- training[-inTrain,]
dim(trainSet);dim(testSet)</pre>
```

```
## [1] 13737 53
```

## [1] 5885 53

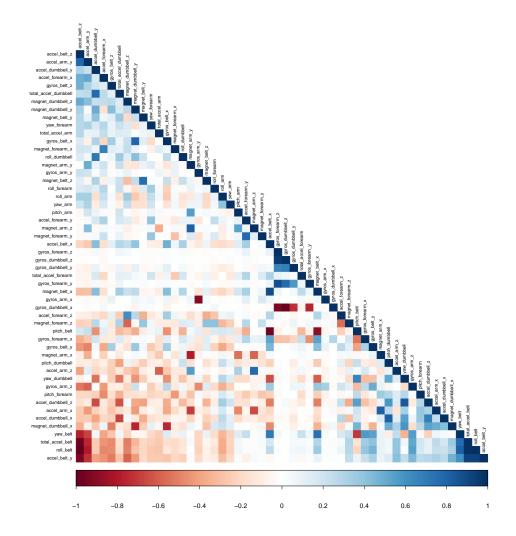

```
# set classe as.factor
trainSet$classe <- as.factor(trainSet$classe)
testSet$classe <- as.factor(testSet$classe)</pre>
```

## **Correlation Analysis**

We will look at the number of highly correlated variables to see if a Principal Component Analysis (PCA) should be done.

```
correlationMatrix <- cor(trainSet[,-53])
corrplot(correlationMatrix, order="FPC", method="color", type="lower",
    tl.cex=0.6, tl.col=rgb(0,0,0))</pre>
```

fig. 1 - Correlation Table

From the graph, there appears to be a number of \_highly correlated variables. If PCA is performed, interptretability will be lost and will not be performed.

PCA will be explored if scalability of the select model becomes necessary.

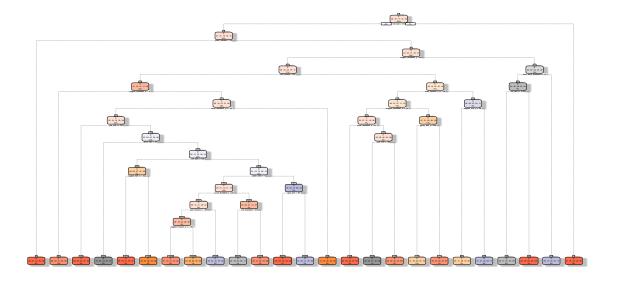

## Modeling

Three models will be build with the trainSet data; Decision Tree, Random Forest and Generalized Boosted. The models will be build and cross-validated with the testSet. The model that has the highest accuracy while considering the kappa score will be used against the testing.

#### **Decision Tree**

```
mdl_dt <- rpart(classe~., data=trainSet, method="class")
fancyRpartPlot(mdl_dt, sub="", palettes=c("Reds", "Greys"))</pre>
```

fig 2. - Decision Tree

```
prd_dt <- predict(mdl_dt, newdata=testSet, type="class")
cm_dt <- confusionMatrix(prd_dt, testSet$classe)
cm_dt</pre>
```

## Balanced Accuracy
                           0.9860
                                             0.9670
                                                                0.9873
acc_gbm <- round(cm_gbm$overall['Accuracy'],4)</pre>
kap_gbm <- round(cm_gbm$overall['Kappa'],4)</pre>
```

### Results

```
result_dt <- as.data.frame(rbind(c(acc_dt,kap_dt)))
result_rf <- as.data.frame(rbind(c(acc_rf,kap_rf)))
result_gbm <- as.data.frame(rbind(c(acc_gbm,kap_gbm)))
tab <- rbind(result_dt, result_rf, result_gbm)
row.names(tab) <- c("Decision Tree", "Random Forest", "Generalized Boosted Method")

# Pretty output
kable(tab, "latex", caption="Results") %>%
    kable_styling(full_width=FALSE, position="left",
        latex_options=c("striped","hold_position"), stripe_index=c(2),
        stripe_color = "yellow")
```

Table 1: Results

	Accuracy	Kappa
Decision Tree	0.7618	0.6971
Random Forest	0.9925	0.9905
Generalized Boosted Method	0.9633	0.9536

Based on the Accuracy and Kappa values for each of the models, the Random Forest Model is selected. Both Accuracy and the Kappa values are higher than the others.

## Predictions for the Quiz

The selected model will be applied to testing data to predict the classe for the 20 rows of data

```
prd_quiz <- predict(mdl_rf, newdata=testing)
prd_quiz</pre>
```

```

### Dataset provided by Instructor taken from:

• http://web.archive.org/web/20161224072740/http:/groupware.les.inf.puc-rio.br/har

#### Visualization

• The Classe decision tree was plotted using the R Rattle package.

## "classe" Definitions

```
Class A - Exactly according to the specification
```

Class B - Throwing the elbows to the front

Class C - Lifting the dumbbell only halfway

Class D - Lowering the dumbbell only halfway

Class E - Throwing the hips to the front

```
print("Head Information Before Cleaning:")
```

### Before Cleaning Head and is.na's
